

NSD NOSQL DAY02

- 1. [案例1：部署redis集群](#)
- 2. [案例2：管理redis集群](#)

1 案例1：部署redis集群

1.1 问题

- 具体要求如下：
 - 准备集群环境
 - 安装redis并创建集群
 - 查看集群信息
 -
- 1.

1.2 方案

搭建redis集群，拓扑规划如图-1所示：

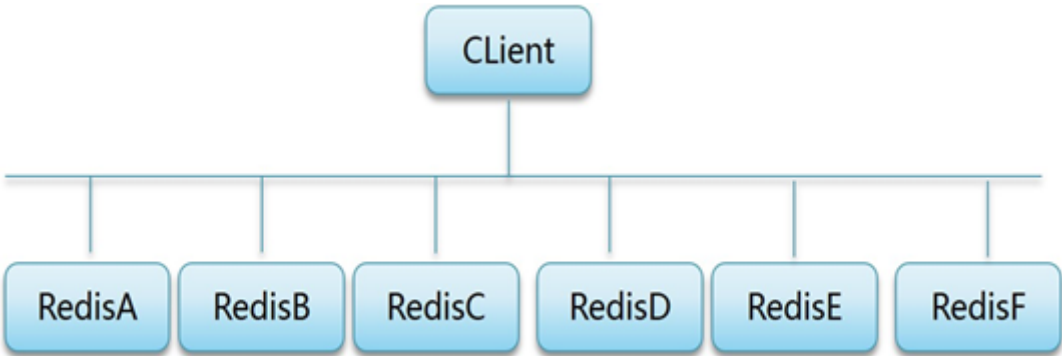

图 - 1

IP，端口规划如表-1所示：

表-1

主机名	IP 地址	端口号
redisA	192.168.4.51	6351
redisB	192.168.4.52	6352
redisC	192.168.4.53	6353
redisD	192.168.4.54	6354
redisE	192.168.4.55	6355
redisF	192.168.4.56	6356

1.3 步骤

实现此案例需要按照如下步骤进行。

[Top](#)

步骤一：准备集群环境

1) 按照表-1配置主机名, ip地址, 配置yum源(系统源) 这里不再操作

2) 把redis的软件包传到6台数据库服务器上面, 安装redis服务器, 六台服务器同样操作(以51为例)

```

01. [ root@redisA ~] # yum -y install gcc gcc-c++ make
02. [ root@redisA ~] # cd redis
03. redis/      redis-cluster/
04. [ root@redisA ~] # cd redis/
05. [ root@redisA redis] # ls
06. Inmp redis-4.0.8.tar.gz
07. [ root@redisA redis] # tar -xf redis-4.0.8.tar.gz
08. [ root@redisA redis] # cd redis-4.0.8/
09. [ root@redisA redis-4.0.8] # make && make install
10. [ root@redisA redis-4.0.8] # ./utils/install_server.sh
11. Welcome to the redis service installer
12. This script will help you easily set up a running redis server
13.
14. Please select the redis port for this instance: [ 6379]
15. Selecting default: 6379
16. Please select the redis config file name [ /etc/redis/6379.conf ]
17. Selected default - /etc/redis/6379.conf
18. Please select the redis log file name [ /var/log/redis_6379.log]
19. Selected default - /var/log/redis_6379.log
20. Please select the data directory for this instance [ /var/lib/redis/6379]
21. Selected default - /var/lib/redis/6379
22. Please select the redis executable path [ /usr/local/bin/redis-server]
23. Selected config:
24. Port      : 6379
25. Config file : /etc/redis/6379.conf
26. Log file   : /var/log/redis_6379.log
27. Data dir    : /var/lib/redis/6379
28. Executable  : /usr/local/bin/redis-server
29. Cli Executable : /usr/local/bin/redis-cli
30. Is this ok? Then press ENTER to go on or Ctrl-C to abort.
31. Copied /tmp/6379.conf => /etc/init.d/redis_6379
32. Installing service...
33.
34.
35. Successfully added to chkconfig!
36. Successfully added to runlevels 345!
37. Starting Redis server...

```

[Top](#)

```

38.  Installation successful! //安装成功
39.
40.  [root@redisA redis-4.0.8] # ss - antlp | grep 6379 //查看时有端口
41.  LISTEN 0 128 127.0.0.1:6379 *: * users:(("redis-server'

```

2) 修改配置文件，6台redis服务器都要修改（以51为例子）

```

01.  [root@redisA redis-4.0.8] # /etc/init.d/redis_6379 stop
02.  //停止已经开启的redis服务
03.  Stopping ...
04.  Waiting for Redis to shutdown ...
05.  Redis stopped
06.
07.
08.  [root@redisA redis-4.0.8] # vim /etc/redis/6379.conf
09.  ...
10.  bind 192.168.4.51 //修改ip
11.  port 6351 //不允许相同，只指定物理接口的ip
12.  daemonize yes //以守护进程方式运行
13.  pidfile /var/run/redis_6351.pid
14.  cluster-enabled yes //是否启用集群，前提是以守护进程方式运行
15.  cluster-config-file nodes-6351.conf
16.  //存储集群信息的配置文件，自动生成，不允许相同
17.  cluster-node-timeout 5000 //集群节点通信超时时间
18.  ...
19.  [root@redisA redis-4.0.8] # /etc/init.d/redis_6379 start //启动服务
20.  Starting Redis server...
21.  [root@redisA redis-4.0.8] # ss - antlp | grep 6351 //查看有端口
22.  LISTEN 0 128 192.168.4.51:6351 *: * users:(("redis-ser
23.  LISTEN 0 128 192.168.4.51:16351 *: * users:(("redis-ser
24.  [root@redisA redis-4.0.8] # ps - C redis
25.  PID TTY TIME CMD

```

注意：其他几台主机在修改时请注意ip，端口等的修改，不要和51主机的一样

3) 关闭防火墙51-56主机（以51为例子）

[Top](#)

```

01.  [root@redisA redis-4.0.8] # getenforce

```

02. Permissive
- 03.
04. [root@redisA redis- 4.0.8] # systemctl disable firewalld
05. //关闭防火墙不自启

4) 查看集群信息

01. [root@redisA redis- 4.0.8] # redis- cli - h 192.168.4.51 - p 6351
02. 192.168.4.51: 6351> ping
03. PONG
04. 192.168.4.51: 6351> cluster info
05. cluster_state: fail
06. cluster_slots_assigned: 0
07. cluster_slots_ok: 0
08. cluster_slots_pfail: 0
09. cluster_slots_fail: 0
10. cluster_known_nodes: 1
11. cluster_size: 0
12. ...
- 13.
14. 192.168.4.51: 6351> cluster nodes
15. f81f997d5ed988ec1587558e78d5f7dbc96abcbf : 6351@16351 my self , master - 0 0 0 connec

步骤二：创建集群（在任意一台上执行创建集群的脚本都可以）这里在51上面执行

1) 部署ruby脚本运行环境（在51上面执行）

01. [root@redisA redis- 4.0.8] # cd /root/redis- cluster/
02. [root@redisA redis- cluster] # ls
03. redis- 3.2.1.gem ruby- devel- 2.0.0.648- 30.el7.x86_64.rpm
04. [root@redisA redis- cluster] # yum - y install ruby rubygems
- 05.
06. [root@redisA redis- cluster] # rpm - ivh -- nodeps \
07. ruby- devel- 2.0.0.648- 30.el7.x86_64.rpm
08. warning: ruby- devel- 2.0.0.648- 30.el7.x86_64.rpm: Header V3 RSA / SHA 256 Signature, ke
09. Preparing... ##### [100%]
10. Updating / installing... [Top](#)
11. 1: ruby- devel- 2.0.0.648- 30.el7 ##### [100%]
12. [root@redisA redis- cluster] # which gem

13. `/usr/bin/gem`
14. `[root@redisA redis-cluster] # gem install redis`
15. Successfully installed redis- 3.2.1
16. Parsing documentation for redis- 3.2.1
17. Installing ri documentation for redis- 3.2.1
18. 1 gem installed

2) 生成创建集群的脚本

01. `[root@redisA redis-cluster] # cd /root/redis/redis- 4.0.8/src/`
02. `[root@redisA src] # cp redis-trib.rb /usr/local/bin/`
03. `[root@redisA src] # ll /usr/local/bin/redis-trib.rb`
04. `-rw-r--r-- 1 root root 65991 Sep 27 16:12 /usr/local/bin/redis-trib.rb`

3) 创建集群

01. `[root@redisA src] # redis-trib.rb create --replicas 1 \`
02. `192.168.4.51:6351 192.168.4.52:6352 \`
03. `192.168.4.53:6353 192.168.4.54:6354 \`
04. `192.168.4.55:6355 192.168.4.56:6356`
05. `// --replicas 1 给每一个主配置一个从库`
06. `[root@redisA log] # redis-trib.rb create --replicas 1 192.168.4.51:6351 192.168.4.52:6352`
07. `>>> Creating cluster`
08. `>>> Performing hash slots allocation on 6 nodes...`
09. `Using 3 masters:`
10. `192.168.4.51:6351`
11. `192.168.4.52:6352`
12. `192.168.4.53:6353`
13. `Adding replica 192.168.4.55:6355 to 192.168.4.51:6351`
14. `Adding replica 192.168.4.56:6356 to 192.168.4.52:6352`
15. `Adding replica 192.168.4.54:6354 to 192.168.4.53:6353`
16. `...`
17. `...`
18. `...`
19. `[OK] All nodes agree about slots configuration.`
20. `>>> Check for open slots...`
21. `>>> Check slots coverage...`
22. `[OK] All 16384 slots covered.`

[Top](#)

4) 查看集群信息，任意一台主机访问本机的redis服务查看即可

cluster info 查看集群信息

cluster nodes 查看集群节点信息

```

01. [root@redisA log] # redis-cli -h 192.168.4.52 -p 6352
02. 192.168.4.52:6352> CLUSTER INFO
03. cluster_state:ok //状态
04. cluster_slots_assigned:16384
05. cluster_slots_ok:16384
06. cluster_slots_pfail:0
07. cluster_slots_fail:0
08. cluster_known_nodes:6
09. cluster_size:3
10. cluster_current_epoch:6
11. cluster_my_epoch:2
12. cluster_stats_messages_ping_sent:367
13. cluster_stats_messages_pong_sent:327
14. cluster_stats_messages_meet_sent:5
15. cluster_stats_messages_sent:699
16. cluster_stats_messages_ping_received:327
17. cluster_stats_messages_pong_received:372
18. cluster_stats_messages_received:699
19.
20. 192.168.4.52:6352> CLUSTER NODES //查看集群节点信息
21. 63afbb5e7d63b1f142358634578a3488e3c9e634 192.168.4.54:6354@16354 slave bc5c4e082
22. bc5c4e082a5a3391b634cf433a6486c867cf c44b 192.168.4.53:6353@16353 master - 0 15380
23. 28e06c5f24a2b6c6412f81369e09bc9653cc51ff 192.168.4.56:6356@16356 slave 8568fbd73c
24. 7e8d9121f44d8331ff55b45c218b87df9bda1b70 192.168.4.55:6355@16355 slave a3083123b
25. 8568fbd73cb296cad6915d524e34761b2114af47 192.168.4.52:6352@16352 my self , master -
26. a3083123bc5c87a76aab2655171634d4ee84f418 192.168.4.51:6351@16351 master - 0 15380
27. 192.168.4.52:6352>

```

5) 测试集群

命令：

redis-cli -c -h ip地址 -p 端口

[Top](#)

```

01. [root@redisA log] # redis-cli -c -h 192.168.4.51 -p 6351

```

```

02. 192.168.4.51:6351> set name jim
03. - > Redirected to slot [ 5798] located at 192.168.4.52:6352
04. OK
05. 192.168.4.52:6352> get name
06. "jim"
07. 192.168.4.52:6352> set class linux
08. OK
09. 192.168.4.52:6352> get class
10. "linux"
11. 192.168.4.52:6352> set pay 26800
12. - > Redirected to slot [ 4013] located at 192.168.4.51:6351
13. OK
14. 192.168.4.51:6351> get pay
15. "26800"

```

集群不能用的情况：

有半数或者半数以上的主库机器挂掉，集群就不能用了

把一个从库升级成主，没有从库，集群不能用（前提是：有半数或者半数以上的主库机器挂掉）

一个主库挂掉，它的从库自动顶替为主库，正常使用（前提是：有半数或者半数以上的主库机器能用），挂掉的主库修复好后，会成为从库，不会抢占为主

6）集群节点选举策略（三主，三从）

停止某个主库的redis服务，对应的从库会自动升级为主库

先查看节点信息的主从情况

```

01. [ root@redisA log] # redis-cli -c -h 192.168.4.51 -p 6351
02. 192.168.4.51:6351> CLUSTER nodes
03. ...
04. 8568fbd73cb296cad6915d524e34761b2114af47 192.168.4.52:6352@16352 master - 0 1538x
05. 28e06c5f24a2b6c6412f81369e09bc9653cc51f 192.168.4.56:6356@16356 slave 8568fbd73c
06. ...
07. 192.168.4.51:6351>

```

看谁是谁的从库，如：

看节点前后的编号id是否有相同的

如：8568fbd73cb296cad6915d524e34761b2114af47

发现52的从库为56

停止主库52

[Top](#)

```

01. [root@redisA log] # redis-cli -h 192.168.4.52 -p 6352 shutdown
02. [root@redisA log] # redis-cli -c -h 192.168.4.51 -p 6351
03. 192.168.4.51:6351> CLUSTER NODES
04. ...
05. 8568fbd73cb296cad6915d524e34761b2114af47 192.168.4.52:6352@16352 master,fail - 153
06. 28e06c5f24a2b6c6412f81369e09bc9653cc51f 192.168.4.56:6356@16356 master - 0 15380
07. ...

```

开启52，发现52成为从库

```

01. [root@redisB redis-4.0.8] # /etc/init.d/redis_6352 start
02. Starting Redis server...
03. [root@redisA log] # redis-cli -c -h 192.168.4.51 -p 6351
04. 192.168.4.51:6351> CLUSTER NODES
05. 8568fbd73cb296cad6915d524e34761b2114af47 192.168.4.52:6352@16352 slave 28e06c5f2

```

2 案例2：管理redis集群

2.1 问题

- 具体要求如下：
- 练习添加主机
- 练习删除主机

2.2 步骤

实现此案例需要按照如下步骤进行。

步骤一：添加主机

1) 部署一台新redis服务器，ip为192.168.4.58，装包，初始化，启用集群配置，重启服务（这里之前已经操作过，不会的可以参考案例1）

2) 添加集群4.58（添加master节点）

格式：redis-trib.rb 选项 参数

选项：add-node 添加主机（不指定角色为主）

由于之前是在51上面创建ruby脚本，所以只有51上面有redis-trib.rb命令，在51上面执行

```

01. [root@redisA ~] # redis-trib.rb add-node 192.168.4.58:6358 192.168.4.51:6351
02. >>> Adding node 192.168.4.58:6358 to cluster 192.168.4.51:6351 Top
03. >>> Performing Cluster Check ( using node 192.168.4.51:6351)
04. S: a3083123bc5c87a76aab2655171634d4ee84f418 192.168.4.51:6351

```

```

05. slots: ( 0 slots) slave
06. replicates 7e8d9121f 44d8331ff 55b45c218b87df 9bda1b70
07. M: 7e8d9121f 44d8331ff 55b45c218b87df 9bda1b70 192.168.4.55: 6355
08. slots: 0- 5460 ( 5461 slots) master
09. 1 additional replica( s)
10. S: 8568f bd73cb296cad6915d524e34761b2114af 47 192.168.4.52: 6352
11. slots: ( 0 slots) slave
12. replicates 28e06c5f 24a2b6c6412f 81369e09bc9653cc51ff
13. M: bc5c4e082a5a3391b634cf 433a6486c867cf c44b 192.168.4.53: 6353
14. slots: 10923- 16383 ( 5461 slots) master
15. 1 additional replica( s)
16. S: 63afb b5e7d63b1f 142358634578a3488e3c9e634 192.168.4.54: 6354
17. slots: ( 0 slots) slave
18. replicates bc5c4e082a5a3391b634cf 433a6486c867cf c44b
19. M: 28e06c5f 24a2b6c6412f 81369e09bc9653cc51ff 192.168.4.56: 6356
20. slots: 5461- 10922 ( 5462 slots) master
21. 1 additional replica( s)
22. [ OK] All nodes agree about slots configuration.
23. >>> Check for open slots...
24. >>> Check slots coverage...
25. [ OK] All 16384 slots covered.
26. >>> Send CLUSTER MEET to node 192.168.4.58: 6358 to make it join the cluster.
27. [ OK] New node added correctly .

```

3) 检查集群主机的状态信息

选项 : check 检查权限

```

01. [ root@redisA ~] # redis-trib.rb check 192.168.4.58: 6358 //查看状态
02. >>> Performing Cluster Check ( using node 192.168.4.58: 6358)
03. M: c5e0da48f 335c46a2ec199f aa99b830f 537dd8a0 192.168.4.58: 6358
04. slots: ( 0 slots) master //发现没有hash槽
05. 0 additional replica( s)
06. M: 7e8d9121f 44d8331ff 55b45c218b87df 9bda1b70 192.168.4.55: 6355
07. slots: 0- 5460 ( 5461 slots) master
08. 1 additional replica( s)
09. ...
10. S: a3083123bc5c87a76aab2655171634d4ee84f 418 192.168.4.51: 6351
11. slots: ( 0 slots) slave
12. replicates 7e8d9121f 44d8331ff 55b45c218b87df 9bda1b70
13. [ OK] All nodes agree about slots configuration.

```

[Top](#)

14. >>> Check for open slots...
15. >>> Check slots coverage...
16. [OK] All 16384 slots covered.

4) 手动对集群进行分片迁移

选项：reshard 重新分配hash槽

01. [root@redisA ~] # redis-trib.rb reshard 192.168.4.58:6358
02. How many slots do you want to move (from 1 to 16384) ?4096
03. //拿出多少个hash 槽给主机192.168.4.58
04. What is the receiving node ID? c5e0da48f335c46a2ec199faa99b830f537dd8a0
05. //主机192.168.4.58的id值
06. Source node #1: all //从当前所有的主里面获取hash槽
07. Do you want to proceed with the proposed reshard plan (yes/no) ?yes
08. ...
09. Moving slot 12283 from 192.168.4.53:6353 to 192.168.4.58:6358:
10. Moving slot 12284 from 192.168.4.53:6353 to 192.168.4.58:6358:
11. Moving slot 12285 from 192.168.4.53:6353 to 192.168.4.58:6358:
12. Moving slot 12286 from 192.168.4.53:6353 to 192.168.4.58:6358:
13. Moving slot 12287 from 192.168.4.53:6353 to 192.168.4.58:6358:

再次查看发现4.58有4096个hash slot

01. [root@redisA ~] # redis-trib.rb check 192.168.4.58:6358
02. >>> Performing Cluster Check (using node 192.168.4.58:6358)
03. M: c5e0da48f335c46a2ec199faa99b830f537dd8a0 192.168.4.58:6358
04. slots: 0-1364,5461-6826,10923-12287 (4096 slots) master
05. 0 additional replica(s)

5) 删除master角色的主机

先删除主机占用的hash槽

01. [root@redisA ~] # redis-trib.rb reshard 192.168.4.58:6358
02. How many slots do you want to move (from 1 to 16384) ?4096
03. //移除hash 槽的个数
04. What is the receiving node ID? bc5c4e082a5a3391b634cf433a6486c867cf c44b
05. //要移动给谁的id即目标主机 (这里可以随机写一个master的ID)

14. Moving slot 12286 from c5e0da48f335c46a2ec199f aa99b830f537dd8a0
15. Moving slot 12287 from c5e0da48f335c46a2ec199f aa99b830f537dd8a0
16. Do you want to proceed with the proposed reshard plan ( yes/no )? yes //提交
17. ...
18. Moving slot 12282 from 192.168.4.58:6358 to 192.168.4.53:6353:
19. Moving slot 12283 from 192.168.4.58:6358 to 192.168.4.53:6353:
20. Moving slot 12284 from 192.168.4.58:6358 to 192.168.4.53:6353:
21. Moving slot 12285 from 192.168.4.58:6358 to 192.168.4.53:6353:
22. Moving slot 12286 from 192.168.4.58:6358 to 192.168.4.53:6353:
23. Moving slot 12287 from 192.168.4.58:6358 to 192.168.4.53:6353:

```

删除集群主机4.58(删除之后redis服务自动关闭)

```

01. [ root@redisA ~] # redis-trib.rb del-node 192.168.4.58:6358 \
02. c5e0da48f335c46a2ec199f aa99b830f537dd8a0 //删除谁+删除的id
03. >>> Removing node c5e0da48f335c46a2ec199f aa99b830f537dd8a0 from cluster 192.168.4.
04. >>> Sending CLUSTER FORGET messages to the cluster...
05. >>> SHUTDOWN the node.

```

6) 添加从节点主机, 随机添加

```

01. [ root@redisA ~] # redis-trib.rb add-node --slave \
02. 192.168.4.57:6357 192.168.4.51:6351
03. >>> Adding node 192.168.4.57:6357 to cluster 192.168.4.51:6351
04. >>> Performing Cluster Check ( using node 192.168.4.51:6351)
05. .....
06. .....
07. [ OK ] All 16384 slots covered.
08. Automatically selected master 192.168.4.51:6351
09. >>> Send CLUSTER MEET to node 192.168.4.57:6357 to make it join the cluster.

```

[Top](#)

10. Waiting for the cluster to join.
11. >>> Configure node as replica of 192.168.4.51:6351
12. [OK] New node added correctly .

7) 移除从节点，从节点主机没有槽位范围，直接移除即可

命令格式：

redis-trib.rb del-node 192.168.4.57:6357 主机id值

01. [root@redisA ~] # redis-trib.rb del-node 192.168.4.57:6357 \
02. f6649ea99b2f01faca26217691222c17a3854381
03. >>> Removing node f6649ea99b2f01faca26217691222c17a3854381
04. from cluster 192.168.4.57:6351
05. >>> Sending CLUSTER FORGET messages to the cluster...
06. >>> SHUT DOWN the node.
